

Write a Modal from Scratch using React

Create a page with three buttons. When any of the three buttons is clicked, a modal will popup. Add a text box in the modal, as the user types into the text box, show the text on the page.

Business Requirements

- Only one modal should be allowed to open at any given time
- The modals should have the basic ability to submit, cancel and close

Tech Requirements

- Manage the state of the page and the modals using Redux
- Use ES6
- Add tests using Jest or Enzyme
- Add comments to your code to explain your thought process

Extra Credit

Create a NodeJS server, when a user submits a modal, save the output to a local file or simple JSON key store

*** Please do not use any databases, persist your data using a file**
